

## Key Takeaway

EventShiftFlow recovers useful flow direction and magnitude using no dividers, no DSP blocks, and no floating-point arithmetic, using **under 2 kB of on-chip storage**. This represents **orders of magnitude lower resource usage** than EDFLOW (855 kB, 669 DSPs), enabling **real-time flow estimation on the smallest neuromorphic robotic platforms**.

## Motivation

Event cameras detect per-pixel brightness changes asynchronously with **microsecond temporal resolution, high dynamic range, and low power consumption**. This makes them attractive for low-latency motion estimation on **size-, weight-, and power-constrained (SWaP) platforms** such as micro aerial vehicles.

### Existing methods

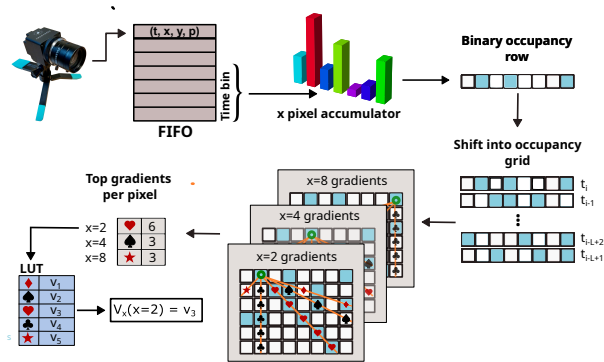

Plane fitting, contrast maximization, and deep learning require **floating-point arithmetic, iterative optimization, or large memory buffers...**

...Infeasible on small chips or FPGAs!

### Research question

How can we estimate motion using the smallest compute footprint possible, suitable for SWaP-constrained uses?

## Algorithm: Bitvector-based motion estimation

Events → fixed-duration time bins → 1-bit occupancy grid (thresholded event counts/pixel/axis) → velocity hypotheses scored by counting coincidences along diagonal traces through a shift-register grid - pure integer arithmetic. Uses only shift registers, counters, and comparators.

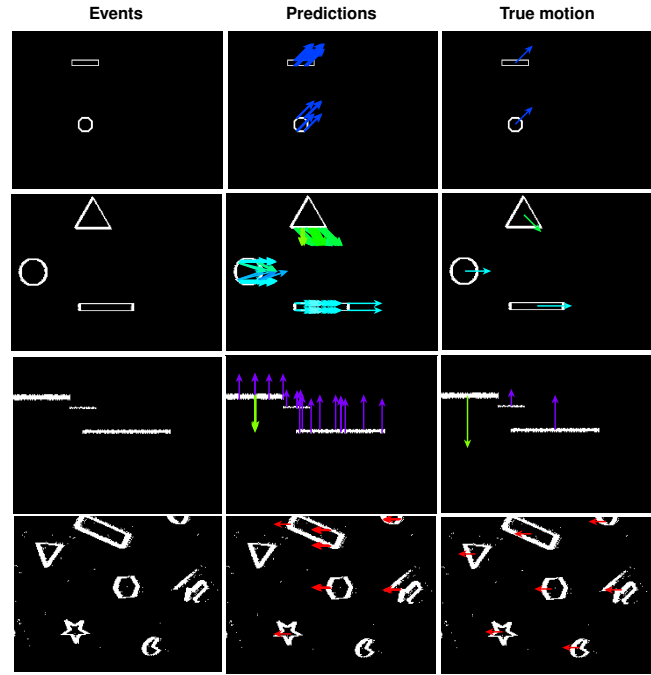

Streaming pipeline. X and Y axes processed identically in parallel.

## The case for adaptive time bins

| Time bin $\Delta t$    | $\theta=10$                  | $\theta=30$                  | $\theta=50$                  | $\theta=70$                 | $\theta=90$                 |
|------------------------|------------------------------|------------------------------|------------------------------|-----------------------------|-----------------------------|
| $\Delta t=60\text{ms}$ | n<50<br>p=67.6%              | n<50<br>p=61.8%              | n<50<br>p=53.0%              | <b>83%</b><br>p=45.6% n=115 | <b>86%</b><br>p=37.9% n=344 |
| $\Delta t=40\text{ms}$ | n<50<br>p=65.0%              | n<50<br>p=54.7%              | <b>81%</b><br>p=43.2% n=178  | <b>95%</b><br>p=27.6% n=531 | <b>94%</b><br>p=16.1% n=159 |
| $\Delta t=20\text{ms}$ | n<50<br>p=59.8%              | <b>95%</b><br>p=36.8% n=1043 | <b>100%</b><br>p=14.1% n=441 | n<50<br>p=5.0%              | n<50                        |
| $\Delta t=10\text{ms}$ | <b>92%</b><br>p=47.5% n=114  | <b>100%</b><br>p=10.0% n=435 | n<50<br>p=0.9%               | n<50                        | n<50                        |
| $\Delta t=5\text{ms}$  | <b>83%</b><br>p=24.7% n=6774 | n<50<br>p=0.6%               | n<50                         | n<50                        | n<50                        |

Results report directional accuracy on the Mueggler et al. Rotating Shapes Dataset, where  $p$  is occupancy density and  $n$  is the number of detections. Best performance at occupancy density  $p \in [10\%, 40\%]$ . Adaptive  $\Delta t$  via density feedback eliminates manual tuning.

Events, predicted flow, and ground-truth for 6 test scenarios. Rows 1–3 synthetic, Row 4 real data (Mueggler et al.)

Length of arrow  $\propto$  speed

## Algorithm Parameters

| $\Delta t$ | Time bin duration | $\theta_e$ | Event threshold | $L$     | Temporal depth | $\theta_s$ | Score threshold | $J$             | Hypotheses | $\beta$ | Min in-bounds steps |
|------------|-------------------|------------|-----------------|---------|----------------|------------|-----------------|-----------------|------------|---------|---------------------|
| 5–50 ms    | 5–50 ms           | 30–100     | 30–100          | 16 bins | 16 bins        | 0.3 L      | 0.3 L           | $\pm 15$ px/bin | 4          | 4       |                     |

## Resource Comparison

| Method                       | Block RAM    | DSPs     | Storage          | FP/Div    | Directional accuracy (real data)             | On-chip storage (both axes)       |
|------------------------------|--------------|----------|------------------|-----------|--|-----------------------------------|
| EDFLOW [Liu'22]              | 390 (855 kB) | 669      | 855 kB           | Yes       | <b>99.5%</b>                                 | <b>&lt; 2 kB</b>                  |
| Aung et al. [2018]           | 138          | 16       | ~270 kB          | Yes       |  |                                   |
| <b>EventShiftFlow (ours)</b> | <b>0</b>     | <b>0</b> | <b>&lt; 2 kB</b> | <b>No</b> | <b>210 ns</b><br>per-pixel latency @ 100 MHz | <b>0</b><br>DSP blocks & dividers |

## Artix-7 FPGA Prototype

| FPGA Device         | Artix-7 xc7a100htg256-2            | Slice LUTs      | 13,326 (~21% of device) |
|---------------------|------------------------------------|-----------------|-------------------------|
| Tool                | Vivado 2025.2                      | Slice Registers | 5,517 (~4%)             |
| Clock               | 100 MHz (+0.030 ns slack)          | Block RAM       | 0 tiles                 |
| Scoring Latency     | 2400 cycles = 24 $\mu$ s @ 100 MHz | DSP Blocks      | 0                       |
| Total on-chip Power | 0.142 W                            | Axis            | x-axis (prototype)      |

Prototype includes full UART-to-motion path (event framing, AXI FIFO, LED debug). Core motion-scoring datapath uses only a fraction of the reported resources.

## Limitations

### Velocity quantization

Velocity estimates are limited to the tested delay hypotheses. Increasing resolution requires more hypotheses and hardware resources.

### Sensitivity to scene complexity

Robustness in cluttered and dynamic environments remains to be validated.

### Sensitivity to event density

Performance depends on occupancy density within each time bin. Requires adaptive time-binning.

## Future Work

### 2-Axis FPGA prototype

Extend x-axis design to full 2D; validate with a live event camera stream.

### Temporal regularisation

Majority voting, exponential smoothing, or score bonus for the previous winner. Add "momentum".

### Polarity-aware scoring

Exploit sign consistency of moving edges to improve discrimination at no additional memory cost.
